# TOTAL SINGULARITY DEGREE 4, CASE $1+3$ 

## E. D. DAHL

Let $q$ and $q^{\prime}$ be members of $Q$. Let $c$ and $c^{\prime}$ be members of a cyclic cubic field $K$. The Galois group of $K$ is $C_{3}$, which we will write multiplicatively. Let $C_{3}$ be generated by $g$ and denote the action of $g$ (resp. $g^{2}$ ) on $c$ by $c^{*}$ (resp. $c^{* *}$ ). By analogy with the cross-ratio of four rational values, define an invariant $I_{1}$ which is a function of $q$ and $c$ as follows:

$$
I_{1}(q, c)=\frac{(q-c)\left(c^{*}-c^{* *}\right)}{\left(q-c^{* *}\right)\left(c^{*}-c\right)}
$$

Using the embedding of the cyclic cubic field into the algebra, express the elements $c$ and $c^{\prime}$ as follows:

$$
\begin{gathered}
c=z+r J(\theta) \\
c^{\prime}=z^{\prime}+r^{\prime} J\left(\theta^{\prime}\right)
\end{gathered}
$$

The embedding was chosen so that the Galois conjugates of $c$ and $c^{\prime}$ can be expressed easily. For example:

$$
\begin{aligned}
& c^{*}=z+r J\left(\theta+\frac{2 \pi}{3}\right) \\
& c^{* *}=z+r J\left(\theta+\frac{4 \pi}{3}\right)
\end{aligned}
$$

The Galois conjugates of $c^{\prime}$ are similar. The invariant $I_{1}$ then assumes this form:

$$
I_{1}(q, c)=\frac{(q-z-r J(\theta))\left(J\left(\theta+\frac{2 \pi}{3}\right)-J\left(\theta+\frac{4 \pi}{3}\right)\right)}{\left(q-z-r J\left(\theta+\frac{4 \pi}{3}\right)\right)\left(J\left(\theta+\frac{2 \pi}{3}\right)-J(\theta)\right)}
$$

Equate the invariant $I_{1}$ evaluated at $(q, c)$ and $\left(q^{\prime}, c^{\prime}\right)$ :

$$
I_{1}(q, c)=I_{1}\left(q^{\prime}, c^{\prime}\right)
$$

$I_{1}\left(q^{\prime}, c^{\prime}\right)$ has this value:

$$
I_{1}^{\prime}=\frac{\left(q^{\prime}-z^{\prime}-r^{\prime} J\left(\theta^{\prime}\right)\right)\left(J\left(\theta^{\prime}+\frac{2 \pi}{3}\right)-J\left(\theta^{\prime}+\frac{4 \pi}{3}\right)\right)}{\left(q^{\prime}-z^{\prime}-r^{\prime} J\left(\theta^{\prime}+\frac{4 \pi}{3}\right)\right)\left(J\left(\theta^{\prime}+\frac{2 \pi}{3}\right)-J\left(\theta^{\prime}\right)\right)}
$$

Multiply through by the denominators in the two expressions for $I_{1}(q, c)$ and $I_{1}\left(q^{\prime}, c^{\prime}\right)$ to get this equation:
$L H S=(q-z-r J(\theta))\left(J\left(\theta+\frac{2 \pi}{3}\right)-J\left(\theta+\frac{4 \pi}{3}\right)\right)\left(q^{\prime}-z^{\prime}-r^{\prime} J\left(\theta^{\prime}+\frac{4 \pi}{3}\right)\right)\left(J\left(\theta^{\prime}+\frac{2 \pi}{3}\right)-J\left(\theta^{\prime}\right)\right)$
